Arun,

I'd like to modify the metrics using which we are analysing the feedback for the data science mentors, hence kindly provide an algorithmic SOP on how you are analysing this.

I will be setting up a new procedure and migrating our metrics into a non-linear scale, which will replace the procedure which we have been following currently to make our analysis more efficient.

I will send the modified metrics after I receive your document.

Kindly close it within 10 minutes.

regards,

Kaustav Basu **FACE Prep**

Dear Kaustav,

As previously discussed with Ashok, the current feedback analysis framework has been standardized and implemented uniformly across all colleges and departments.

To briefly outline the existing process: feedback is collected department-wise with a minimum response rate of 90%. Ratings are calculated both at the overall, department, and subject levels, and NPS (Net Promoter Score) is also computed and reflected in the dashboards accordingly. Based on the analysis, key student concerns and challenges are consolidated and communicated to the respective Senior Manager/Campus Manager. This feedback mechanism is primarily intended to capture student concerns and challenges and to get an idea of how mentors perform from the students' perspective, with comparatively less emphasis on mentor performance evaluation, as mentor performance is assessed more comprehensively through demos and vivas conducted by the SMEs.

Since the process is common across departments in colleges, implementing changes exclusively for the Data Science mentors would not be feasible at this stage. Any revisions to the analysis methodology would require a broader discussion and approval from Ashok, rather than being implemented independently. I kindly request that you discuss this further with Ashok.

TL; DR: My designation states that I am the SME of Data Science. That makes me credible about making decisions regarding data and metrics. I'd like to own this entire evaluation gambit.

The current "standardized" framework prioritizes administrative uniformity over statistical accuracy, which renders it futile for high-precision benchmarking in the Data Science vertical.

The primary technical failures are:

- **Linear Scale Compression:** Treating the 1–5 rating as a linear interval is mathematically flawed. The cognitive and pedagogical effort required to move from a 4 to a 5 is exponentially higher than from a 1 to a 2. By using simple averages, we are suppressing the data of our top-tier performers and masking mediocrity.
- **NPS Misalignment:** Net Promoter Score is a proxy for student "likability" and sentiment, not technical competency. Relying on NPS creates an incentive for mentors to prioritize "entertainment" over "rigor," leading to a dilution of the curriculum's depth.
- **Sample Size Variance:** A 90% response rate on a cohort of 10 students ($N=10$) has insufficient statistical power to differentiate between genuine skill and outlier bias compared to larger cohorts. Bayesian shrinkage is required to normalize these scores; otherwise, the "Standardized" dashboard is presenting noise as fact.

Uniformity is currently being used as a shield against accuracy. I will discuss with Ashok why a high-skill domain like Data Science requires a non-linear, weighted evaluation model to maintain actual quality standards.

regards,

Kaustav Basu

Dear Arun,

I'll wait for your guidance on how to proceed with this and what would be the best way to handle the data.

I request you to handle the sessions for my students on my behalf so that both the mentors and I can benefit.

Till the time, all my demos and evaluations would be kept on hold.

regards,

Dear Kaustav,

You should understand how to reply to emails and talk to people. Please grow up.

I have been trying to close this for the last two weeks. Things are already been quite hectic and I'm not getting any cooperation TBH.

regards,
Kaustav Basu
